AND STATE HEALTH OFFICER

CONTENTS

Introduction	7
 GENERAL TABLES 	
Table I.—Total births and deaths (exclusive of stillbirths) with rate per 1,000 population for the years 1914-1936, inclusive	14
Table II.—Births (exclusive of stillbirths) in each county, by color, with rate per 1,000 population, per cent attended by physicians and number illegitimate, 1936	15
Table II-A.—Births (exclusive of stillbirths) in each city of 10,000 population or over in 1930, by color, with rate per 1,000 population; per cent attended by physicians and number illegitimate, 1936	19
Table III.—Deaths (exclusive of stillbirths) for the State as a whole from each cause, by sex, color and age 1936 (includes all deaths occurring in North Carolina and residents of North Carolina who died in other states)	20
Table IV.—Deaths (exclusive of stillbirths) in each county, by color, with rate per 1,000 population, 1936	66
Table V.—Deaths (exclusive of stillbirths) in each county, by cause of death (abridged international list) and by color of decedent, 1936	70
Table VI.—Deaths (exclusive of stillbirths) in cities or towns, by cause of death (abridged international list) and by color of decedent, 1936	120
Table VII.—Death rates per 100,000 population (by place of death, also by place of usual residence) in each county, from nine important causes, with estimated population, 1936	130
Table VIII.—Deaths (exclusive of stillbirths) by cause by certain subdivisions of the first year of life, 1936	134
Table IX.—Deaths under 1 year of age (exclusive of stillbirths), and maternal deaths in each county with rates per 1,000 live births, 1936	136
Table X.—Cases and deaths from special diseases by month of occurrence, 1936	138
Table XI.—Cases from 30 of the reportable diseases by counties, 1936	142
Table XII.—Death rates per 100,000 population from ten important causes, for the State as a whole, with estimated population for each year, 1914-1936	146

LETTER OF TRANSMITTAL

Raleigh, N. C., February 18, 1938.

*To His Excellency, CLYDE R. HOEY,
Governor of North Carolina,
Raleigh.*

My dear Governor Hoey:

I have the honor of transmitting the report for the Bureau of Vital Statistics covering the calendar year 1936.

With assurance of my very best respect, I am

Sincerely,

CARL V. REYNOLDS, M.D.,
Secretary and State Health Officer.

ANNUAL REPORT OF THE BUREAU OF VITAL STATISTICS

This annual report of the Bureau of Vital Statistics for the twenty-first year of State registration presents tabulations of births and deaths for the calendar year 1936. This report marks the fourth year in which all births and deaths have been allocated to residence so far as it was possible to ascertain the residence. Births have been allocated to the legal residence of the mother and deaths to the place of legal residence before death of the deceased. In order to permit comparison with years before tabulations by place of residence were begun, deaths and births have been recorded by place of occurrence and by place of residence.

Although tabulation by residence corrects one, probably the greatest, source of error in comparing the rates of different localities there are other factors that must be taken into consideration. For example, the rates given in this report are crude rates in the calculation of which no allowance is made for the differences in sex, age and color distribution of the population. Furthermore, the degree of completeness of reporting may vary in different localities and this should be taken into consideration when comparing the rates of two areas.

POPULATION

Population estimates for the State, and more especially for its political sub-divisions, may vary widely from the true population for no census has been taken since 1930. State rates are based on the Census Bureau estimate of 3,457,000 population. The Bureau of Vital Statistics has estimated that 2,441,000 are white and 1,016,000 are colored. To arrive at an estimated population for each county the increase computed for the State as a whole was distributed among the counties in proportion to the share which each county had in the increase between 1920 and 1930. No estimate was made for areas where the population decreased between 1920 and 1930, the figures shown being those of the 1930 Federal Census.

NATALITY

Live Births: The birth rate of 22.1 per 1,000 population was the lowest rate ever recorded for North Carolina. In actual numbers there were 3,275 fewer births than in 1935. This rep-

resents a decline in the rate from 23.3 per 1,000 population to 22.1. Of the 76,321 live births, 52,408 were white; 23,218 negro; and 695 Indian which gives rates of 21.5 per 1,000 population for white and 22.9 for negro. The birth rate ranged between 30 and 35 per 1,000 population from 1914 to 1924. From the latter date the rate rapidly dropped to 24.7 in 1929 and since that time there has been a slight tendency for it to decrease.

Stillbirths: In conformity with statistical practice, the stillbirths were not included in the totals of either births or deaths, but tabulated separately. There were 135 fewer stillbirths than last year, but the rate of 40.9 per 1,000 live births is identical with that for 1935. If they were classified as a single cause of death, the rate based on 100,000 population would be greater than that of tuberculosis and influenza combined. In every 100 deliveries there were approximately four stillbirths.

MORTALITY

In the compilation of mortality statistics the cause of death as stated by the physician is used as the basis of classification by causes. Since the accuracy of statistics can be no greater than that of the material upon which they are based, it is desirable that physicians give as accurate and complete a diagnosis of the cause of death as possible. A specific cause, rather than a general condition or symptom, is essential if the greatest accuracy is to be expected. Failure to conform with this rule necessitates that hundreds of certificates be queried yearly as to cause of death in order to classify them correctly.

The health conditions in North Carolina for 1936 as indicated by the death rate were, in general, not so favorable as for the preceding year. There were more deaths recorded from all causes combined, and consequently a higher death rate than for 1935. The 35,580 deaths, exclusive of stillbirths, represent an annual death rate of 10.3 per 1,000 population. The mortality rate for 1935 was 9.8; for 1934, 10.6; and for 1933, 9.3. Considered in terms of total deaths, the number reported for 1936 was 2,129 more than for 1935.

When the deaths from all causes are analyzed it is discovered that the largest proportional increase occurred among the group of degenerative diseases. This group—heart diseases, chronic nephritis, cerebral hemorrhage, cancer, diseases of the arteries, diabetes, and angina pectoris—, seven in all, accounted for 14,925 deaths, or 42 per cent of the deaths from all causes. Of the

2,129 deaths over the 1935 total this group was responsible for 1,320, or 62 per cent of the increase. Therefore, the increase in the number of deaths over 1935 is due in a larger measure to the degenerative diseases than to infectious and contagious or other causes.

TABLE 1. DEATHS FROM DEGENERATIVE DISEASES

<i>Cause of Death</i>	<i>Number</i>	
	<i>1935</i>	<i>1936</i>
Heart Diseases	4,459	4,944
Cerebral Hemorrhage	2,909	3,250
Chronic Nephritis	2,954	3,190
Cancer	1,811	1,819
Angina Pectoris	758	835
Diseases of the Arteries.....	337	478
Diabetes	377	409
Total.....	13,605	14,925

The principal causes of death in 1936 in order of their rank were diseases of the heart, nephritis, cerebral hemorrhage, the pneumonias, accidents, congenital malformations and diseases of early infancy, tuberculosis and cancer. The relative positions of the various causes of death have changed within the past twenty years. Tuberculosis ranking first in 1914 with a rate of 139 per 1000,000 population has decreased to seventh place in 1936 with a rate of 60.8.

Heart diseases rank first in 1936 in the list of causes of death. In 1914 there were 1,780 deaths charged to this condition and in 1935 diseases of the heart, including angina pectoris, accounted for 5,733 deaths. This represents a rate twice that of 1914. Nephritis, second in importance, was seventh twenty years ago. The death rate from pneumonias has changed little, but due to the increase in deaths from other conditions, pneumonia has dropped from second to fourth place. Diarrhea and enteritis, a a major cause of death in 1914, is tenth in 1936. The rate has fallen from 98.8 per 100,000 population in 1914 to 33.2 in 1936. Modern sanitary measures have played a large part in reducing the death rate from diarrhea among infants.

Typhoid Fever: Continuing the downward trend there was a decrease in the number of deaths from typhoid fever. The 71 deaths from this cause were eleven fewer than for 1935, nine

fewer than for 1934, and 57 fewer than for 1933, with a consequent lowering of the death rate from 2.4 per 100,000 population in 1935 to 2.1 for the present year. The improvement in this condition can be appreciated by comparing the rate of 35.8 in 1914, or a total of 839 deaths, to the present record low rate of 2.4.

Smallpox: This is the fifth consecutive year that no deaths were reported from smallpox. There were 19 cases reported to the Division of Epidemiology. In 1935 there were 24 cases reported.

Diphtheria: The record for 1936 reveals an increase in diphtheria deaths with a higher death rate than in 1935. There were 190 deaths with a rate of 5.5 per 100,000 population compared to 164 deaths with a rate of 4.8 for 1935. There was a seventy per cent reduction in the mortality rate from this disease between 1915 and 1931, but no significant change in the rate since with the exception of the decrease shown in 1935 which is partly lost for the present year. This failure to show continued improvement is all the more striking since diphtheria is a disease for which we have a highly efficacious protective vaccine. In round numbers, five-sixths of the deaths from diphtheria occur in children under five years of age. This indicates that vaccination to be most profitable must be done long before the child becomes of school age.

Influenza and Pneumonia: There were 3,239 deaths from pneumonia and 1,163 deaths from influenza, making a total of 4,402 recorded for 1936. The deaths from these two conditions give a rate of 127.3 per 100,000 population for 1936 as against a rate of 113.0 for 1935. There were 130 more deaths from influenza during 1936 than for the previous year and 411 more from the pneumonias.

Tuberculosis: The death rate from all forms of tuberculosis was 60.8 in 1936 and 56.7 in 1935. This represents an increase in actual numbers of 166. Tuberculosis ranked first among all causes of death in 1914, but has fallen to seventh place in 1936. In the past twenty years the mortality rate has declined by approximately 65 per cent.

Of the 2,102 deaths from all forms of tuberculosis, 51 per cent were males and 49 per cent females; 44 per cent were white and 56 per cent negro. The colored rate of 110.5 for tuberculosis is almost three times the white rate of 35.5.

Cancer: Cancer accounted for 1,819 deaths in 1936 giving a rate of 51.6 against a rate of 52.1 for 1935 and 54.0 for 1934. While the trend of cancer mortality has been steadily upward in the past, we have at least held our own for the past four years and it is not unreasonable to hope for the prevention of an increase.

Pellagra: The mortality from pellagra continued the downward trend begun in 1931, but interrupted by an increase for 1934. The rate for 1936 was 10.3 per 100,000 population. This was lower than the 11.4 for 1935 and 13.2 for 1934. The peak year for pellagra deaths was 1930 when 1,015 were charged to this disease.

Suicides and Homicides: There were 302 suicides compared to 276 for 1935. This accounted for an increase in the rate from 8.1 per 100,000 population to 8.7. There were 3 more homicidal deaths in 1936 than in 1935, the totals being 402 and 399 respectively.

Accidental Causes: Violent and accidental deaths, exclusive of suicides and homicides, increased from 2,385 in 1935 to 2,519 in 1936 placing violent and accidental deaths fifth among the principal causes of death. Automobile accidents accounted for the greatest number of accidental deaths. There were 1,006 deaths from all types of automobile accidents in 1936 and 1,058 in 1935. There were 109 railroad accidents in 1936 and 105 in 1935, exclusive of collisions with automobiles.

Maternal Mortality: The diseases of pregnancy, childbirth and the puerperal state continued to exact a large number of lives. Deaths from maternal causes and the maternal mortality rates per 1,000 live births for the past eight years are shown in Table 2. There was a decrease of 22 maternal deaths from the 1935 figures in approximately 3,000 fewer births, which gives the same maternal mortality rate. There were 532 maternal deaths in 1936 to 554 in 1935 giving a rate of 7.0 per 1,000 live births for each year. This is in excess of the rate of approximately 6.5 for the United States Registration Area. There were 309 white, 222 negro and 1 Indian puerperal deaths, accounting for a death rate of 5.9 per 1,000 live births for the white and 9.6 for the colored.

TABLE 2.—TOTAL MATERNAL DEATHS AND RATES,
1929-1936.

<i>Year</i>	<i>No. of Deaths</i>	<i>Rate</i>
1929	684	8.8
1930	645	8.4
1931	640	8.5
1932	555	7.1
1933	535	7.1
1934	605	7.6
1935	554	7.0
1936	532	7.0

Albuminuria and eclampsia, as in previous years, accounted for more of the puerperal deaths than any other single cause. The second and third greatest offenders were puerperal septi-cemia and puerperal hemorrhage, respectively. Albuminuria and eclampsia with other toxemias of pregnancy account for 187 maternal deaths, which is 35 per cent of all maternal deaths.

Infant Mortality: The total number of deaths under one year of age was 5,221 or 188 fewer than occurred in 1935. The rate for 1936 was 68.4 per 1,000 live births and 67.9 in 1935. Of the total deaths 3,123 were white and 2,069 negro. This gave a rate of 59.6 for the white and 89.1 for the negro. The number of deaths of infants under one year of age and the infant mortality rates per 1,000 live births for the past nine years are shown in Table 3.

TABLE 3.—TOTAL INFANT DEATHS AND RATES,
1928-1936.

<i>Year</i>	<i>No. of Deaths</i>	<i>Rate</i>
1928	6,929	85.6
1929	6,112	79.2
1930	6,021	78.4
1931	5,459	73.0
1932	5,173	66.4
1933	4,974	66.0
1934	6,196	77.9
1935	5,407	67.9
1936	5,221	68.4

Five principal causes of infant mortality accounted for 68 per cent of all infant deaths. These causes with the number of infant deaths charged to each were as follows:

Premature birth	1,472
Diarrhea and enteritis	676
Pneumonias	605
Sudden death (cause not specified)	507
Congenital debility	302
<hr/>	
Total	3,562

Of the 5,221 deaths of infants under one year of age, 1,241 or 24 per cent died during the first day of life and 2,141 or 41 per cent within the first week.

REGISTRATION

Every birth and death occurring in North Carolina should be recorded with the Bureau of Vital Statistics. To the individual the registration of a birth occurring in North Carolina makes it possible always to obtain an official record of the facts surrounding his advent into life. The purposes for which certified copies of birth certificates are requested indicate that their value is becoming more generally realized from year to year. Likewise, the demand for death certificates show that this vital record is essential in upholding the right of citizens in the establishment of necessary facts in the closing event of life.

Vital Statistics are of inestimable value to the public health workers, but without complete registration full reliance cannot be placed on the data. For health organizations accurate certificates are essential if our true problems are to be known, if our programs are to be intelligently planned and we are to ascertain their effectiveness and if errors in our work are to be detected. It is, therefore, important that every effort be made to promote the completeness of our birth and death records.

TABLE I—TOTAL BIRTHS AND DEATHS (EXCLUSIVE OF STILLBIRTHS) WITH RATE
PER 1,000 POPULATION FOR THE YEARS 1914-1936 INCLUSIVE

YEAR	Births		Deaths	
	Number	Rate	Number	Rate
1914.....	*71,931	31.2	29,044	12.4
